

## A List of the Fishes in the Collection of the Raffles Museum

By M. W. F. TWEEDIE, M.A.

By far the greater part of the named collection of fishes in the Raffles Museum has been identified by Prof. Dr. L. F. de Beaufort and Prof. Dr. Max Weber of the University of Amsterdam, their work on the collection having proceeded to some extent concomitantly with the publication of the later volumes of their monographic work on the Fishes of the Indo-Australian Archipelago.

Other specialists who have studied material from the collection are Dr. F. P. Koumans of the Leiden Museum, who identified the gobies in the collection sent to Amsterdam, Mr. J. R. Norman of the British Museum who dealt with the flatfishes, and Mr. A. Fraser-Brunner of the British Museum who identified a small collection of Balistidae and Pomacanthinae, and is at present engaged on the Monacanthidae and Syngnathidae. The collection also includes paratypes of *Gobiella birtwistlei* Herre<sup>1</sup>, and Dr. Herre is at present working in collaboration with Dr. G. S. Myers of the U. S. National Museum on freshwater fishes collected recently by the staff of the Raffles Museum.

Finally the list includes a number of species identified by members of the museum staff. In the absence of comparative material these identifications are strictly confined to species whose characters are so well defined as to render mistakes in their determination highly improbable.

The species identified by Weber and de Beaufort are listed without comment, those determined by other specialists are

FISHES IN THE RAFFLES MUSEUM

accompanied by the initials of the specialist in question and those determined by members of the museum staff are marked with an asterisk.

The sources of the collection are various and a complete enumeration of them in this introduction would be redundant. Of the marine forms the greater part have been obtained in the Singapore fishmarkets and by the experimental trawler S.T. "Tongkol" in 1926 and 1927, mostly in the South China Sea off the east coast of the Malay Peninsula. The freshwater forms were obtained partly by the Fisheries Department, Straits Settlements and Federated Malay States, in various localities in the Malay Peninsula, mostly between 1922 and 1929. The remainder have been donated or obtained by members of the museum staff on collecting expeditions.

References in literature are given to those species which have been described from the collections of the Raffles Museum.
